

From V-Clinic to a continuous health loop

Not another medical system, but a layer that connects screening, the clinician, wearables and the person's life between visits.

VIAI'S VISION

“We believe the future of healthcare is not limited to hospitals. It will be in homes, communities, sports facilities and smart health centres...”

Abdulla AbuEbeid
Co-Founder and CEO, VIAI Tech Group

The strong moment is V-Clinic. The big opportunity is everything between visits.

A deep screening becomes far more valuable when its context does not disappear the moment the person walks out of the clinic.

ASSESSMENT 01

V-Clinic

movement
VO₂ / cardio
biometrics
clinician context

30–90 days of real life

ASSESSMENT 02

V-Clinic

change over time
response to the protocol
new baseline
next plan

OUR READING

The point is not to measure more. It is to keep the context, see what changes, and hand the next visit the full story.

A continuous intelligence layer around V-Clinic

One shared context links preparation, screening, the clinician's decision, plan adherence and reassessment.

One profile. Every interaction adds context.

Not another dashboard, but a persistent model of the person, their plan and their response to interventions.

BASELINE	goals · history · limitations · past injuries
SCREENING	V-Clinic data · VO ₂ · movement · biometrics
DAILY SIGNALS	sleep · HR · activity · training · symptoms
INTERVENTIONS	protocols · recommendations · plan adherence
OUTCOMES	change · response · recovery · new baseline

QUESTIONS THE SYSTEM CAN ANSWER

- 01 What has changed since the last screening?
- 02 Is the person following the agreed plan?
- 03 Which signals need the clinician's attention?
- 04 How did the intervention affect recovery?
- 05 With what context should the next visit begin?

Two AI copilots. One shared context.

The person gets continuity. The clinician gets scale without losing clinical control.

FOR THE PERSON

24/7 companion

The assistant knows the plan

Sees the agreed protocol and the current signals.

Short check-ins

Collects symptoms, recovery and plan adherence.

Visible progress

Shows what changes between screenings.

Multilingual

One conversational interface across languages.

FOR THE CLINICIAN

Clinical leverage

Pre-visit brief

The clinician gets the essentials before the session.

Ambient documentation

Structured notes without post-visit paperwork.

Changes and exceptions

Attention only where the context has actually changed.

Voice + follow-up

Search across the profile and automation of routine follow-up.

The core clinical modules are already built and deployed

For VIAI this is not greenfield development: we propose adapting an existing stack to the specific V-Clinic workflow.

AI INTAKE

structured questionnaire and a short pre-visit summary

AMBIENT AI

real-time transcription and structuring of the consultation

UNIFIED PROFILE

visits, history, metrics and wearable data in one context

MONITORING

between-visit observation, assistant and follow-up

HEALTHY4U CLINICAL CASE

GavCure · private practice

Proof that we can build and deploy the loop, not a promise of the same numbers for VIAI.

15+ min →
30 sec

history preparation

+30%
patients per day

100%
visits with a structured summary

One workflow. 6–8 weeks. 20–50 users.

We do not replace the VIAI platform. We assemble one closed scenario around V-Clinic and measure whether it creates value.

01

Connect

V-Clinic results
wearables
short AI intake

02

Build the profile

baseline
screening summary
shared context

03

Close the loop

approved protocol
check-ins
monitoring

04

Equip the clinician

brief
changes
attention flags

05

Measure

usage
adherence
time saved

SUCCESS CRITERIA

clinician time · protocol adherence · engagement after screening · return visit · volume of usable longitudinal data

If the loop works, we scale it to other scenarios and locations. If it does not, we stop without a large platform bet.

Thirty minutes. One scenario.

Walk through one V-Clinic user's journey: from context to screening, from protocol to monitoring between visits, and show which parts can already be assembled on the existing Ocean Tech stack.

Discuss the pilot

OUR HYPOTHESIS

VIAI can own not only the measurement, but the context between measurements.

That is where the continuous relationship with the user, the outcome data and a new layer of value around V-Clinic appear.
